The study of the parasitofauna of the stickleback in Poland has been dealt with in a number of papers /see Grabda J., 1971/. The examined material came from different localities, mostly, however, from the area of the large lake in the interior. In July 1988, 1989 and 1990 we had the opportunity to study the parasites of the *G. aculeatus* L. from the surroundings of Gdansk /the Baltic Sea coast/. We examined 126 examples from 6 localities. By another authors were examined 122 examples. Altogether 248 stickleback were studied. However ^(many authors) don't give the exact number of examined fish. On that material were found the following species of parasites: *Glugea anomala* /Moniez, 1887/, *Trichodina domerquei* /Wallengreen, 1897/, *Trichodina domerquei* f. *latispina* Dogiel, 1940, *Trichodina pediculus* Ehrenberg, 1838; *Gyrodactylus arcuatus* Sychowsky, 1933, *Brachyphallus crenatus* /Rudolphi, 1802/, Odhner, 1905, *Phyllodistomum simile* Nybelin, 1926, *Diplostomum spathaceum* /Rudolphi, 1819/ Braun, 1893, *Tylodelphys clavata* /Nordmann, 1832, Diesing, 1850, *Tetracptyle* sp. Rokicki, Vojtková 1991, *Proteocephalus percae* /Müller, 1780/, *Proteocephalus cernuae* /Gmelin, 1799/, *Proteocephalus* sp. Milicer, 1938, *Triaenophorus nodulosus* /Pallass, 1781/, *Schistocephalus solidus* /Müller, 1776/, *Raphidascaris gracillima* /Linstow, 1800/ Skrjabin, 1923, *Sterliadochona tenuissima* /Zeder, 1800/, *Camallanus lacustris* /Zoega, 1776/, *Neoechinorhynchus rutili* /Müller, 1780/, *Acanthocephalus lucii* /Müller, 1776/ Lütke, 1911, *Hemiclepsis marginata* /Müller, 1774/, *Piscicola geometra* /Linnaeus, 1758/ *Thersitina gasterostei* /Pagenstecher, 1861/, *Caligus lacustris* Steenstrup et Lütken, 1861, *Argulus foliaceus* /Linnaeus, 1758/, *Glochidium* sp. Grabda J., 1971.
